User Guide

A variety of electronic structure methods are implemented in the PySCF package. Many of them can also be used for solid-state calculations with periodic boundary conditions. This User Guide introduces the basic theories of these methods and demonstrates their main functionalities.

Molecular structure [user/gto.html]

Self-consistent field (SCF) methods [user/scf.html]

Density functional theory (DFT) [user/dft.html]

Second-order Møller−Plesset perturbation theory (MP2) [user/mp.html]

GW approximation [user/gw.html]

Configuration interaction (CISD and FCI) [user/ci.html]

Coupled-cluster theory [user/cc.html]

Algebraic diagrammatic construction (ADC) [user/adc.html]

Auxiliary second-order Green's function perturbation theory (AGF2) [user/agf2.html]

Multi-configuration self-consistent field (MCSCF) [user/mcscf.html]

Multi-reference perturbation theory (MRPT) [user/mrpt.html]

Time-dependent Hartree-Fock and density functional theory [user/tddft.html]

Solvation models [user/solvent.html]

QM/MM methods [user/qmmm.html]

Molecular Dynamics [user/md.html]

Density fitting (DF) [user/df.html]

Periodic boundary conditions [user/pbc.html]

Electron-phonon coupling [user/eph.html]

Localized orbitals [user/lo.html]

Seminumerical exchange (SGX) [user/sgx.html]

Geometry optimization [user/geomopt.html]

References [user/reference.html]
